

Baby Gate Wall Protector

Have you ever wondered...

What are the best baby gates?

What are the best dog gates?

How can I make a baby gate more secure?

How can I install a dog gate without damaging the wall?

Use Our Baby Gate Wall Protector!

The best baby gates should remain firmly in place even when they are pushed against by a baby, dog, or by a family pet. Most safety gates rely on the four rubber bumpers that press against the wall to keep the gates anchored in place. Unfortunately, that method is not always reliable. The bumpers rely on friction to keep the gate from moving. But if the friction is not great enough, or if the wall flexes outward slightly, the bumpers can slide and the baby gate can fall over. Our baby gate wall protector has a recessed pocket for the bumper to rest in to help prevent it from moving, providing an additional level of security.

How to Install the Baby Gate Wall Protector

The wall protector has two mounting holes for attaching it to the wall with screws or wall anchors. Four wall protectors should be installed for safety gates that have four bumpers, one wall protector for each bumper. For doorways that are constructed with 2x4 wood studs, mount each wall protector with two #10 flat-head screws of sufficient length to penetrate the studs by at least 1/2 inch. If mounting the wall protector on drywall where no wood studs are present, use #8-10 plastic wall anchors.
